1st National Congress on Immunology, Nutrition and Health

« 1NCINH25 »

01 & 02 July 2025

Introduction

Immunology is the study of the immune system and is a very important branch of the medical and biological sciences. The immune system protects organisms against pathogens and other innocuous substances like pollens, chemicals, potential food allergens and environmental agents. Diet has an influence on virtually every bodily function. It is important for the function of the immune system.

All cells, including immune cells, require sufficient nutrients as part of a diversified and balanced diet for health and for good function, for instance micronutrient and dietary components have very specific roles in the development and maintenance of an effective immune system throughout the life course or in reducing chronic inflammation which leads to the emergence of numerous diseases (Cancer, Arthritis, Cardiovascular and Bowel diseases).

Many micronutrients are required for each stage of the immunological response in the body.

This National Seminar will focus on exploring and promoting scientific and technological advances regarding the relationship between Immunology, Nutrition and Health.

It aims to encourage interdisciplinary exchange among immunologists, medical researchers, health professionals and industrialists.
